

What one symmetry returns

CPT is a symmetry of the universe, not just of its laws

↓ one postulate

the fold's parity is the classical-quantum split

§2.1

$\Theta^2 = 1$, so the sheet average is the fold-even part
and the difference the fold-odd part

a horizon carries a temperature

§3.1

the map is a half-period shift, so the cross-sheet
correlator is a thermofield double

the Einstein equation

§3.6

Clausius on the fold's own horizons, with the
temperature, the entropy law and the horizons all supplied

**19 properties of general relativity out, 4 in
and the metric is never an operator**

The classical world is a horizon
seen from below its temperature
