the class is a curve with an exact end, not a point
the branch ends at $a/M = 3/(4\sqrt{2\sqrt{3}-3}) = 1.10092$, where the double root becomes triple. The same number in every de Sitter background.
every hole on this curve is fold−invariant; at zero spin it is Nariai alone, which is the one member A.15 finds
past extremal Kerr, which a positive Λ permits
$9\,\Lambda M^2$
